

Global Digital Exemplars – our blueprint for digital excellence

Our blueprint consists of a combination of existing software, enhanced software, clinical content and a business change programme.

It includes:

- A mobile digital 'workspace', supporting clinicians throughout the care process, including clinical communication and collaboration, clinically tailored alerting and decision support, clinical noting, e-prescribing, orders and results
- A cross-community shared record, combining patient data and supporting collaborative working across settings and care communities
- Patient involvement and engagement – transforming the services provided into new models of care

Key features of the System C blueprint:

- It is a modular template, consisting of a series of integrated solutions and a blueprint for implementation
- It allows NHS organisations to build up their digital maturity at their own pace, in line with Local Digital Roadmaps, STPs and funding availability
- It can be supplied with the EPR or integrated with existing Trust systems
- It provides a clear path for organisations to reach a UK-equivalent of HIMSS Level 7
- It works both within a Trust and across a whole health economy
- It has a clinical core which will transform the way that clinical users across a care community use IT
- It runs on smartphones, tablets and desktops

It will be delivered using System C's deployment resources. We have the strongest deployment track record in UK healthcare IT.

Developed in partnership with our customers and with University Hospitals Bristol NHS Foundation Trust, our partner in NHS England's Global Digital Exemplar programme.
